The invention relates to a CC method of producing a monomeric monocyclic peptide by a measuring CC beta-beta carbon separation distances on opposite antiparallel strands of CC and cyclising the peptide by oxidising the cysteine residues. The CC monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked CC deleted prior to cyclisation are used to interfere with angiogenesis, CC neovascularisation or lymphangiogenesis in a mammal with a condition CC The condition is diabetic retinopathy, psoriasis, arthropathy, CC hemangioma, vascularised nealignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or clared trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver cin a mammal (the mammal has a condition characterised by fluid CC accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, cor brain. The peptides are used to modulate vascular permeability in the least one biological activity induced by EggF, VegF, or D and are also used in combination with an anti-inflammatory agent, to treat a cc chronic inflammation, especially rheumatoid arthritis, psoriasis and cc diabetto retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ΩV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an isolated type C lectin polypeptide CC (I) comprising amino acid residues 37-1393, 37-174, 175-229, 234-360, 2381-507, 520-645, 667-809, 824-951, 970-1108, 1110-1243, or 1259-1393 CC apable of binding to a carbohydrate residue, and the rest of the polypeptides are useful for producing antibodies capable of binding to a carbohydrate residue, and the rest of the polypeptides. Polynucleotide sequence encoding the polypeptides of their native ligands, and as molecular markers of the tissues in which can be inserted or substituted into other native members of the endocytic type C lectins, and provide hybridisation probes for searching cDNA and genomic libraries for the coding sequence of other type C lectins. The present sequence represents a murine phospholipase A2 receptor to protein which is homologous to a type C lectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ωy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes porteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by concern linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed as the print of the printed and the properties of the printed as the print of the printed and the print of the pri

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic CC polypeptides. The proteins and their associated DNA sequences are used in CC the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (Synovitis, acne, CC pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central CC nervous system, however it is particularly involved in the inflammatory CC lesions associated with acne vulgaris. A method for detecting the Presence or absence of P. acnes in a patient comprises contacting a CC sample with a binding agent that binds to the proteins of the invention CC and determining the amount of bound protein in the sample. The CC polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to CC downregulate expression and activity of P. acnes polypeptides and CC diagnostic agents for determining P. acnes presence, for example, by CC enzyme linked immunosorbent assay (ELISA).

CC Note: The sequence data for this patient did not form part of the printed constitution, but was obtained in electronic format directly from WIPO CC at figure interpretation of antibodies can be used as constitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelliis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC polypeptide (II) sequences. (I) is useful as hybridisation probes, complymerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II). The complymerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II). The complymerased series are also used in diagnostics as expressed sequence tags (C for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or c quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating cd disorders involving aberrant protesh expression or biological activity. (I) and (II) are useful for treating cd disorders involving aberrant protesh exquences have applications in c diagnostics, forensics, gene mapping, identification of mutations in c responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and call acquences. ABG00010-ABG30377 represent novel human c diagnostic amino acid sequences of the invention.

CNOTE: The sequence data for this patent did not appear in the printed conscription of the p
                                                                                                                                                                                                                                                                                       Human; protease; protease inhibitor; protease and protease inhibitor; PPIM; identification; diagnosis; anti-human immunodeficiency virus; HIV; antidiabetic; immunostimulant; immunomodulator; antiinflammatory; antithyroid; immunosuppressive; nephrotropic; antigout; thyromimetic; cytostatic; antibacterial; fungicide; protozoacide; antiarteriosclerotic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAF81714 to AAF81740 encode the human proteases and protease inhibitors (PPIMS) given in AAB74668 to AAB74694. The PPIMS can have activities such as: anti-human immunodeficiency virus (HIV); antidiabetic; antithyroid; immunostimulant; immunomodulator; antiinflammatory; immunosuppressive; cc nephrotropic; antigout; thyromimetic; cytostatic; antiabeterial; cfungicide; protozoacide; antiarteriosclerotic; antiabherosclerotic; cvirucide; antipsoriatic; and hepatotropic. PPIM polynucleotide and prevention of autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome, combined immunodeficiency disease (SCID), Chediak-Higashi cc syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis, crowe's disease, diabetes mellitus, Good pasture's syndrome, gout, cc syndrome, raral, bacterial, fungal, parasitic, protozoal, and helminthic cinfections and cell proliferative disorder such as arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, psoriasis and cancer. PPIM cc polynucleotide sequences can be used in somatic or germline gene therapy can disorder such as arteriosclerosis, conditionation probes useful in mapping the naturally occurring genomic sequences and in molecular biology techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

CC 28 genes, based on the tissues in which they are most highly expressed, CC and include developing products for the diagnosis or treatment of CC proliferative disorders, cancer, tumours, foetal and developmental CC abnormalities, haematopoietic disorders diseases of the immune system, CC AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, CC allergies, neurological disorders (e.g., Alzheimer's disease, CC Parkinson's disease), cognitive disorders, schizophrenia, asthma, CC skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, CC gastrointestinal disorders, angiogenic disorders, kidney disorders, CC gastrointestinal disorders, angiogenic disorders, kidney disorders, CC gastrointestinal disorders, aprograncy-related disorders, endocrine CC disorders, and infections. The proteins can also be used to aid wound CC sunburn, to maintain organs before transplantation, for supporting cell CC culture of primary tissues, to regenerate tissues, to identify their CC cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

CC antibodies specific for a protein of the invention can be used in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human communication contains of the invention.

                                                                                                                                                                                                                                                                                                                                     Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic CC polypeptides. The proteins and their associated DNA sequences are used in CC the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, CC pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. CC P. acnes is also involved in infections of bone, joints and the central CC nervous system, however it is particularly involved in the inflammatory CC lesions associated with acne vulgaris. A method for detecting the Presence or absence of P. acnes in a patient comprises contacting a CC sample with a binding agent that binds to the proteins of the invention CC and determining the amount of bond protein in the sample. The CC polypeptides may be used as antigens in the production of antibodies CC specific for P. acnes proteins. These antibodies can be used to CC downregulate expression and activity of P. acnes polypeptides and CC diagnostic agents for determining P. acnes polypeptides and CC diagnostic agents for determining P. acnes protein in the protein of the protein of the printed CC specification, but was obtained in electronic forms to the printed CC specification, but was obtained in electronic format directly from WIPO CR at firm who introubled for tageneroes.

The inventiuseful in developmental biology and in elucidating cell signalling a cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                   expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB37789 represent sequences used in the exemplification of the

The colon cancer antigens have cytostatic acting and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders
     proliferative disorder; inflammation.

These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 11; SEQ ID NO: 451; 859pp + Sequence Listing; English

Sequences AAU18282-AAU18507 represent endocrine polypeptides of the invention. Endocrine polypeptides and their associated polynucleotides are useful in the diagnosis, treatment and prevention of various types disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by determining the presence or absence of a mutation in an endocrine polynucleotide. The treatable disorders include autoimmune diseases such as rheumatoid arthritis, hyperproliferative disorders such as neoplasms
                                                                                                                                                                                                                                                                       WPI; 200

The invention relates to human polynucleotides (AAI63803-AAI64012) and CC the encoded proteins (AAM434497-AAM460) useful for preventing treating CC or ameliorating medical conditions e.g. by protein or gene therapy. The CC genes were isolated from a range of human tissues disclosed in the CC specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, CC e.g. breast and ovarian cancer and other cancers of the adrenal gland, by the continuous based on the concers, and composition of the adrenal gland, CC urogenital; (b) immune disorders e.g. Addison's disease, allergies, CC crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative CC colitis; (c) cardiovascular disorders such as myocardial ischaemias; CC (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and CC epilepsy; and (f) infectious diseases such as viral, bacterial, fungal CC Note: The sequence data for this patent did not form part of the CC printed specification, but was obtained in electronic format directly crom wipo at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                08-NOV-2000

```
CC polynucleotides and proteins are used to prevent treat a medical CC condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, CC chickens or sheep. For example, disorders associated with decreased CC expression of SPs. The SP polynucleotide or a vector expressing them may CC be administered to treat diseases by gene therapy. Antisense molecules may be administered to down regulate expression of SPs by binding with CC the cells own genes and preventing their expression. The polynucleotides CC may be administered to down regulate expression. The SPs may also be used as Antigens to produce antibodies and to identify modulators (agonists and antagonists) of the SPs. The anti-(SP) antibodies and CC (agonists may also be used to down regulate expression and activity of SP and as diagnostic agents for detecting the presence of SPs in samples. The disorders include for example: immune/autoimmune diseases (e.g. HIV (human immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. Carkinson's disease), neurological diseases (e.g. Alzheimer's disease, CC ariest, tachycardia and angina), infections caused by bacteria, viruses conclude wound healing maintenance of corneal infections). Other uses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-NOV-2000

Title: Perfect score: US-09-761-636A-11 42

Sequence:

Scoring table: Gapop 10.0 , Gapext 0.5

Total number of hits satisfying chosen parameters:

283138 seqs, 96089334 residues

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 10 Listing first 45 summaries 100%

Database PIR\_71:\* pir3:\*
pir4:\* pir1:\* pir2:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DOMAIN: THE MAM DOMAINS PROBABLY MEDIATE SPERM ADHESION TO THE ZONA PELLUCIDA.

DOMAIN: DURING SEERM MIGRATION THROUGH THE REPRODUCTIVE TRACTS, THE MUCIN-LIKE DOMAIN MIGHT INHIBIT INAPPROPRIATE TRAPPING OF SPERMATOZOA OR PROMOTING ADHRSION TO THE OVIDUCTAL ISTHMUS.

DOMAIN: THE VAFD DOMAINS 2 AND 3 MAY MEDIATE COVALENT OLIGOMERIZATION (BY SIMILARITY TO HUMAN INTESTINAL MUCIN MUC2).

PTM: THE MAM DOMAINS AND THE MUCIN-LIKE DOMAINS ARE MISSING FROM THE ZONADHESIN THAT BINDS TO THE EGG EXTRACELLULAR MATRIX. PROCESSING MIGHT OCCUR DURING SPERM MATURATION AND/OR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SIMILARITY: CONTAINS 2 MAM DOMAINS.
